

Risk Portal

Overview

The Syrenis Risk Portal enables organizations to assess, monitor, and manage risk exposure across their digital assets.

As privacy regulations continue to evolve and enforcement activity intensifies, organizations can no longer afford to treat compliance as a one-time exercise. The risks associated with non-compliance - regulatory penalties, reputational damage, and loss of customer trust - are too significant to leave unmonitored. Yet for many organizations, gaining a clear, accurate, and up-to-date picture of their compliance posture across their digital estate remains a significant challenge.

The Syrenis Risk Portal is designed to address this directly. By scanning and analyzing websites to identify privacy, security, and compliance vulnerabilities, the Risk Portal gives compliance, legal, and operational teams the visibility they need to proactively identify and remediate risk - before it translates into regulatory exposure or brand damage.

A Comprehensive View of Compliance Risk:

The Risk Portal assesses each scanned website against a structured set of compliance measures, combining automated scanning with organization-level self-declarations to produce a complete and accurate picture of risk. Each measure is broken down into individual compliance categories, with each category assigned a clear risk level - High, Medium, Low, or Compliant - based on the applicable legislation.

Scan results are presented through an intuitive overview that surfaces the overall risk level alongside a breakdown of high, medium, and low issues identified, giving teams an immediate, actionable summary of their compliance position.

Ongoing Monitoring at Scale:

Compliance is not a point-in-time event - it requires continuous monitoring across a digital estate that is constantly changing. The Risk Portal supports this through flexible scanning options designed to fit how organizations actually operate.

Scans can be run on demand at any time, or scheduled to recur at defined intervals, ensuring that the compliance position of each website in scope is reviewed regularly and automatically. When a scan completes, notification emails are delivered to configured recipients, ensuring that the right people are informed promptly - without needing to monitor the platform directly.

When creating a scan, users can choose between scanning a single specified URL or enabling full site crawling, allowing the scanner to traverse the wider site and produce a more comprehensive assessment of compliance across multiple pages.

Executive Reporting:

In addition to the detailed results available within the Risk Portal interface, users can download a PDF Risk Report for each scan - formatted for management review and audit purposes. This report provides a clear, shareable summary of the organization's compliance position, suitable for presentation to senior stakeholders, legal teams, or regulators.

Multi-Legislation Support:

The Risk Portal is designed to support organizations operating across multiple jurisdictions - not just in how results are filtered, but in how scans are conducted. When configuring the platform, administrators select the legislations their organization operates under. Scans are then assessed against only those applicable frameworks, ensuring results are relevant and free from the noise of regulations that do not apply.

Critically, the Risk Portal goes further than framework filtering alone. When assessing consent banner configuration and behavior, the platform accesses your website as a visitor from each relevant region would - simulating real-world geographic access.

This means the scan doesn't simply check whether a banner exists; it verifies that the correct banner fires for each jurisdiction, that region-specific consent logic behaves as intended, and that users in different locations receive the experience your configuration is designed to deliver. For organizations that serve audiences across multiple regions - each subject to different consent requirements - this geo-aware scanning capability provides a level of assurance that static analysis alone cannot offer.

Integration with the Syrenis Platform:

The Risk Portal sits within the broader Syrenis platform ecosystem, and its value is amplified for organizations that also use the Syrenis Consent Management module. Cookie comparison results draw directly on the organization's existing consent banner and cookie policy configuration, ensuring that the scan reflects the actual consent framework in place rather than a static, manually maintained list.

This integration eliminates duplication of effort and ensures that the risk assessment always reflects the current state of the organization's consent setup.

Summary

The Syrenis Risk Portal gives organizations the visibility, evidence, and confidence they need to manage privacy and compliance risk proactively across their digital estate. From automated cookie and tracking analysis and security posture assessment, through to self-declaration-based compliance measures, scheduled monitoring, site crawling, and downloadable executive reports, the Risk Portal provides a comprehensive and operationally practical solution for organization's that take their compliance obligations seriously.

For compliance teams, it delivers the evidence and audit trail needed to demonstrate accountability. For operational and marketing teams, it surfaces the practical issues - misconfigured cookies, missing banners, unexpected trackers - that can undermine both compliance and business performance. And for senior stakeholders, it provides a clear, accessible view of risk that supports informed decision-making.
